Ethnobotanical investigations were conducted with population and traditional healers in several villages in the North of Madagascar. From this field research, two plants have been selected to justify their traditional use. Tetracera madagascariensis Willd. ex Schltdl. (Dilleniaceae), a species endemic to Madagascar, is traditionally used to treat respiratory disorders. The bronchial asthma is a widespread disease in Madagascar. Bioassay-guided fractionation using isolated guinea pig trachea pre-contracted with histamine revealed significant relaxation (IC50 = 4.085 ± 0.5 mg/ml). The water and ethanol-water extracts of all plants were inactive (IC50 > 100 µg/ml). These results can support using Prasaprophyai in Thai traditional medicine for antipyretic caused by inflammation. This study was realized to investigate the antibacterial activity of extracts from leaves of *Vaccinium vitis-idaea* L. (Ericaceae) against eleven strains of *Escherichia coli*. Leaves of *Vaccinium vitis-idaea* L. collected on Klekovača Mountain (RS, Bosnia and Herzegovina, W. Balkans) were extracted by different solvents (water, ethanol and ethyl acetate). Cultures of bacteria were clinical isolates and standard strain of *E. coli* ATCC 25922. Minimal Inhibitory Concentrations (MICs) and Minimal Bactericidal Concentrations (MBCs) of extracts and antibiotic amoxicillin were determined by tube dilution method. The results revealed that water extract exhibited the highest activity against all strains of *E. coli* (MICs were 5 mg/ml). MICS of ethyl acetate extract were 20 mg/ml for all bacteria strains tested. Ethanol extract exhibited antibacterial activity with MIC values between 20 and 40 mg/ml. In conclusion, water extract from leaves of *Vaccinium vitis-idaea* L. showed high antibacterial activity against *Escherichia coli* with MBCs 5 mg/ml for nine strains and 10 mg/ml for two strains.

Isoflavonoids in tropical and subtropical neglected leguminous species

Sklenickova O.1, Haviš J.2, Prokudina E.1, Lapicik O.1, Kokoska L.1

1Institute of Tropics and Subtropics, Czech University of Life Sciences Prague, Kamýcká 129, 165 21 Prague 6, Czech Republic; 2Faculty of Agrobiology, Food and Natural Resources, Czech University of Life Sciences Prague, Kamýcká 129, 165 21 Prague 6, Czech Rep.: 3Department of Chemistry of Natural Compounds, Institute of Chemical Technology Prague, Technická 5, 166 28 Prague 6, Czech Rep.

Isoflavonoids, bioactive compounds belonging to the phytoestrogens, are known to prevent some kinds of hormone-related cancers and may participate as alternatives to the conventional hormone replacement therapy [1]. Although they have already been identified in about 50 different plant families [2], the quantities were usually in trace amounts and therefore leaves remain the most important source of isoflavonoids. Since the tropical and subtropical regions offer wide range of neglected leguminous species, we decided to analyze 27 of them for the presence of isoflavonoids. Aqueous/methanolic extracts obtained from dried seeds were pretreated on an immunoaffinity column (IAC) [3] and subsequently analyzed by reverse phase HPLC/UV-DAD. Immunosorbents for IAC are characterized by high molecular selectivity so that single group of structurally related compounds can be targeted. UV spectra and retention times were compared with set of standards. As a result, we have identified certain commonly known (e.g. genistin) and high levels of uncharacterized isoflavonoids in several samples. Genistein was present in *Spartium junceum* L. Pachyrhizus tennes Spreng. and *Trigonella foenum-graecum* L. in concentrations 13, 7 and 0.8 µg/g of dry seeds, respectively. Interestingly, the extract of *P. tuberosus* contained significantly higher amounts of total isoflavonoids than soybean. Though presence of isoflavonoids in this species has never been published before, the fact itself is basically not striking, but the amounts are hint for their further investigation and possible use in dietary products. In vitro antibacterial activity of cloves (Syzygium aromaticum) against MRSA

Demirpek U1, Oğuz A.2, Kusa O.3, Güvenç A.4

1GATA Haydarpasa Medical School, Department of Microbiology, 34668, Kadıköy, Istanbul, Turkey; 2Erzincan Mil. Hospital, Biochemistry Lab. 24000 Erzincan Turkey; 3GATA Medical School, Department of Microbiology, 06018 Erdik Ankara, Turkey; 4Ankara University, Faculty of Pharmacy, Department of Pharmaceutical Botany, 06100, Tandoğan, Ankara, Turkey

The process of microbial resistance against antibiotics makes it essential to seek for novel drugs. There have been many studies over the last years, in which a lot of plant species have been checked for their antimicrobial activities. Cloves (*Syzygium aromaticum*), which is a commonly used spice worldwide, have antibacterial, antifungal, antiviral, antioxidant, antiinflammatory, antithrombotic, antiparasitic and antiulcerogenic activities [1]. Staphylococci are a well known cause of both hospital and community acquired infections. Isolates that have acquired methicillin resistance pose serious problems for treatment and eradication. After the introduction of the drug, Methicillin Resistant Staphylococcus aureus (MRSA) strains were reported in the early 1960s. Epidemics have occurred around the world and the clones have diversified since then. MRSA is still on the rise. Nowadays, the imminent threat of reduced susceptibility to vancomycin has emerged [2]. The purpose of this study was to evaluate antibacterial activity of clovers of against MRSA. All 100 (one hundred) clinical MRSA isolates were screened by using agar dilution method. Both aqueous and ethanol extracts of cloves were obtained. All of the strains were found to...
